

F&O Sniper -- Signal P&L Backtest

Capital base Rs 220,000 | 1 resolved trades (0W / 0L / 1 flat) | 1 day span | generated 2026-09-03 | rules v1 (2026-08-30)

■ *Small sample -- treat everything below as a rough first look, not a verified edge. Same caution as every other backtest in this project.*

Strategy Scorecard

STATUS: INSUFFICIENT SAMPLE

Only 1 resolved trades -- below the 20-trade floor to trust a verdict either way.

Fixed, disclosed rule: Promising needs Profit Factor ≥ 1.5 AND Win Rate $\geq 45\%$, both. Below 20 resolved trades it's always Insufficient Sample, regardless of how good the numbers look -- not enough data yet to trust a verdict either way.

Starting Capital (Rs)	220,000
Net P&L (Rs)	0
Return %	0.0%
Trades	1
Win Rate	0.0%
Profit Factor	N/A
Expectancy/Trade (Rs)	0.0
Max Drawdown (Rs / %)	N/A / N/A
Max Drawdown (R-multiple)	N/A
Stop-First Rate	N/A
Average Win (Rs)	N/A
Average Loss (Rs)	N/A
Winning Days	0
Losing Days	0
Average Holding Time	24m

Data Quality & Integrity

Checked before anything above is trusted, not after. Every check here runs against this backtest's own real entry/exit data -- no assumptions, no simulated data.

DATA STATUS: COMPLETE

Suspect: real timestamp corruption exists, or more than 2% of trades look like exact duplicates. Partial: something else below was flagged but nothing structurally broken. Complete: nothing flagged.

Check	Result
Timestamp Integrity	No issues found
Market Hours (09:15-15:40 IST)	No issues found
Duplicate Signals	No issues found
Overlapping Positions	No issues found
Missing/Stale Data	No issues found
Position Sizing	Real per-symbol F&O lot size via lot_size_resolver.py. Capital base = peak real capital committed (sum of qty × entry across every position genuinely open at the same moment, from real timestamps) -- not a flat per-trade guess.
Trading Costs	Not yet modeled -- every P&L figure in this report is gross, not net of brokerage/STT/exchange charges/GST.
Slippage	Not yet modeled.
Liquidity	Not captured -- no volume or bid-ask spread is stored per trade in this project's signal logs.
Corporate Actions	Not captured -- no corporate-action adjustment log exists in this project yet.

NET P&L**Rs 0**

0.0% of capital deployed -- the bottom line everything else here explains.

WIN RATE**0.0%**

0 of 1 trades profitable. A low win rate can still be profitable -- check Profit Factor too.

PROFIT FACTOR**N/A**

Total Rs won / total Rs lost. Above 1 = profitable overall, above 1.5 is solid.

MAX DRAWDOWN**N/A**

The single worst peak-to-trough decline anywhere in this data -- the real pain of the roughest stretch.

SHARPE RATIO**N/A**

Return per unit of total volatility. Above 1 is good, above 2 very good. Needs 2+ days of data.

SORTINO RATIO**N/A**

Like Sharpe, but only penalizes downside swings. Usually reads higher than Sharpe.

CALMAR RATIO**N/A**

Annual return relative to the worst drawdown -- return earned for the pain endured.

CAGR (ANNUALISED)**N/A**

What this rate would compound to over a year. N/A under a week of data -- too short to annualize honestly.

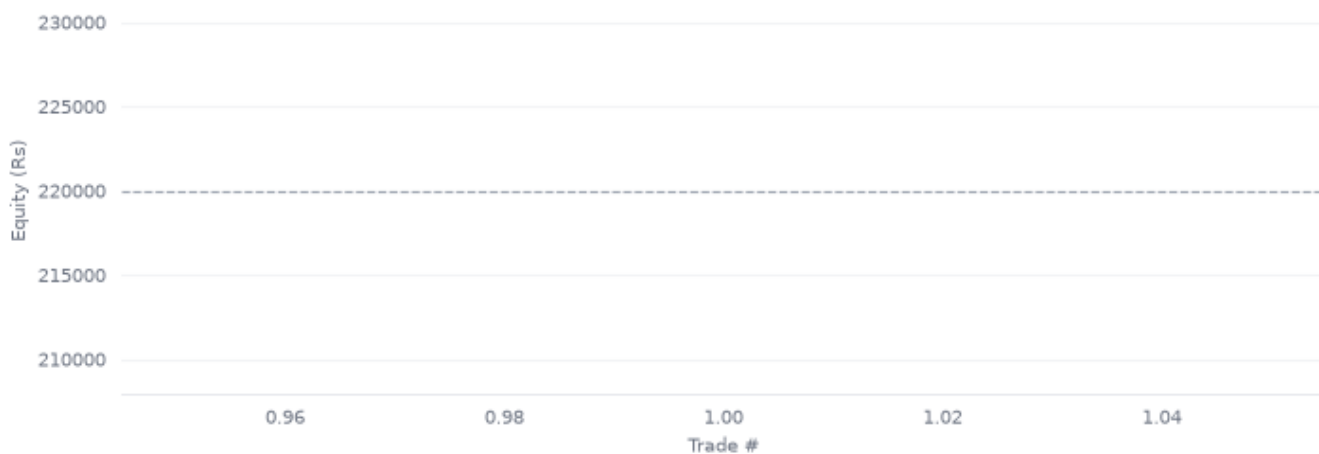

Profit vs Loss Breakdown

Net P&L above is profit minus loss combined into one number. This breaks both sides out separately, so the losses aren't hidden inside the net figure.

Gross Profit (all winning trades)	Rs 0
Gross Loss (all losing trades)	Rs 0
Best single trade	Rs 0
Worst single trade	Rs 0
Best single day	2026-09-03 Rs 0
Worst single day	2026-09-03 Rs 0
Currently underwater	No -- at or above the last peak

Equity Curve

Running account value after every trade, in the order each one actually closed. The dashed line marks where you started (the capital base above) -- above it means net ahead overall, below means net behind.

Drawdown %

How far below the highest point reached so far the account was at each moment, as a %. Always zero or negative -- 0 means sitting at a new high, a deep dip means a real losing stretch that hadn't recovered yet.

R-Multiple Analysis

How many multiples of initial risk (Entry minus SL) each trade returned, independent of position size or premium level -- a Rs 5-risk trade that made Rs 15 is +3R the same as a Rs 50-risk trade that made Rs 150. This is what actually measures setup quality; rupee P&L above doesn't.

N/A -- no trade in this backtest had a valid Entry/SL pair to compute Initial Risk from.

Long vs Short

The same trades split by direction (BUY = bullish, SELL = bearish). Two strategies can share one blended win rate while one side is doing all the work -- this checks whether the edge genuinely holds in both directions rather than assuming it does.

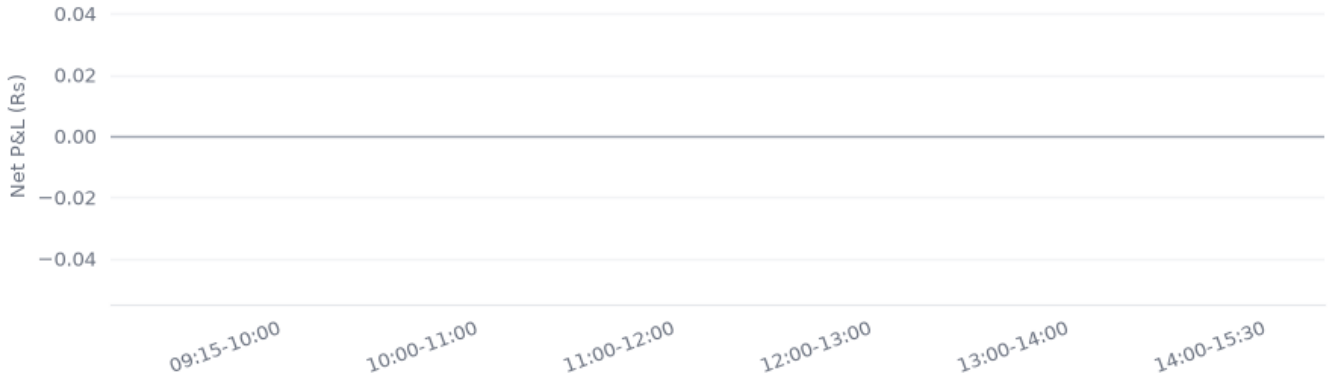

Metric	BUY	SELL
Trades	0	1
Win Rate	N/A	0.0%
Net P&L (Rs)	N/A	0
Profit Factor	N/A	N/A
Expectancy/Trade (Rs)	N/A	0
Average R	N/A	N/A
Avg Holding Time	N/A	24m

No comparison chart -- one side has zero resolved trades.

Time-of-Day Analysis

The same trades split by when they entered, not when they resolved -- finds whether the edge is concentrated in a specific window (e.g. the open) or spread evenly across the day. A window with very few trades isn't a reliable read yet, same small-sample caution as everywhere else in this report.

Time Window	Trades	Win Rate	Net P&L (Rs)	Profit Factor	Avg R
09:15-10:00	0	N/A	N/A	N/A	N/A
10:00-11:00	1	0.0%	0	N/A	N/A
11:00-12:00	0	N/A	N/A	N/A	N/A
12:00-13:00	0	N/A	N/A	N/A	N/A
13:00-14:00	0	N/A	N/A	N/A	N/A
14:00-15:30	0	N/A	N/A	N/A	N/A

Exit Analysis

How every trade actually ended: a real Target hit, a real Stop hit, or an estimated end-of-day mark because neither triggered. Shows where P&L and R actually come from, not just how many trades of each type there were.

Exit Reason	Trades	% of Total	Net P&L (Rs)	Avg R
Other	1	100.0%	0	N/A

No Target-hit exits in this data to compare -- MFE/MAE would need the intratrade price path regardless, which this project's signal logs don't capture.

Time to Target

N/A -- no trade in this backtest has a real Hit At timestamp to measure from.

Score Bucket Calibration

Whether the score actually predicts outcomes, or just ranks candidates. Target-before-SL rate/R figures use rule-resolved trades only within each bucket (an EOD mark isn't evidence the score predicted anything). A monotonic climb from low buckets to high supports treating the score as meaningful; a flat or inconsistent pattern means it currently doesn't, regardless of what any single bucket's number looks like in isolation.

N/A -- no trade in this backtest has a real logged Confidence value to bucket by.

Blended vs. Rule-Resolved Only

The Scorecard above includes every exit type, EOD/manual marks included. This isolates ONLY trades that hit a real SL or Target, to show whether the entry/exit rules themselves have an edge, separate from how many positions just ran out of trading day.

N/A -- no trades hit a real SL or Target in this period (every resolved trade was an EOD/manual mark).

Streaks & Risk

Consecutive win/loss runs and the single biggest swings -- the operational risk a blended win rate and profit factor don't show: how long a real losing run can feel, and how much any one trade, day, or week can move the account.

Max Winning Streak	0 trades
Max Losing Streak	0 trades
Average Winning Streak	N/A
Average Losing Streak	N/A
Largest Single-Trade Gain	0
Largest Single-Trade Loss	0
Best Single Day	2026-09-03 (Rs 0)
Worst Single Day	2026-09-03 (Rs 0)
Best Week	Week of 2026-08-31 (Rs 0)
Worst Week	Week of 2026-08-31 (Rs 0)

Robustness: Trade-Order Resampling

Reshuffles this backtest's own real trade outcomes thousands of times -- same wins, same losses, same win rate, just a different order -- to see how much worse these SAME trades could plausibly have looked from unlucky sequencing alone. Does not test different market conditions, position sizing, or costs/slippage -- those need a real cost model that doesn't exist in this project yet (see Trading Costs on the Data Quality page).

N/A -- needs at least 30 resolved trades for resampling to say anything beyond what Streaks & Risk already shows.

Performance by Segment

The same trades, split by Grade, Sector, OI Confirmation, and Pattern -- shows WHERE performance is concentrated instead of one blended number. Sample column, fixed disclosed thresholds: under 10 trades is Low (do not optimize on it), 10-29 is Preliminary, 30+ is More reliable -- still not proof. Never treat a tiny 100% segment as stronger evidence than a large one just because the percentage looks better.

By Grade

Segment	Trades	Sample	Win Rate	Net P&L (Rs)	Profit Factor
Unknown	1	Low	0.0%	0	N/A

By OI Confirmation

Segment	Trades	Sample	Win Rate	Net P&L (Rs)	Profit Factor
Unknown	1	Low	0.0%	0	N/A

By Pattern

Segment	Trades	Sample	Win Rate	Net P&L (Rs)	Profit Factor
Gap up	1	Low	0.0%	0	N/A

By Sector

Segment	Trades	Sample	Win Rate	Net P&L (Rs)	Profit Factor
Unknown	1	Low	0.0%	0	N/A

Worst Drawdowns

The 5 deepest peak-to-trough declines in account value, worst first. 'Recovered' shows when equity climbed back to the pre-drawdown peak -- '-' means it hasn't yet. 'Trades' is how many trades closed while still underwater, from the peak to recovery (or to now, if still Ongoing).

No drawdown periods yet.

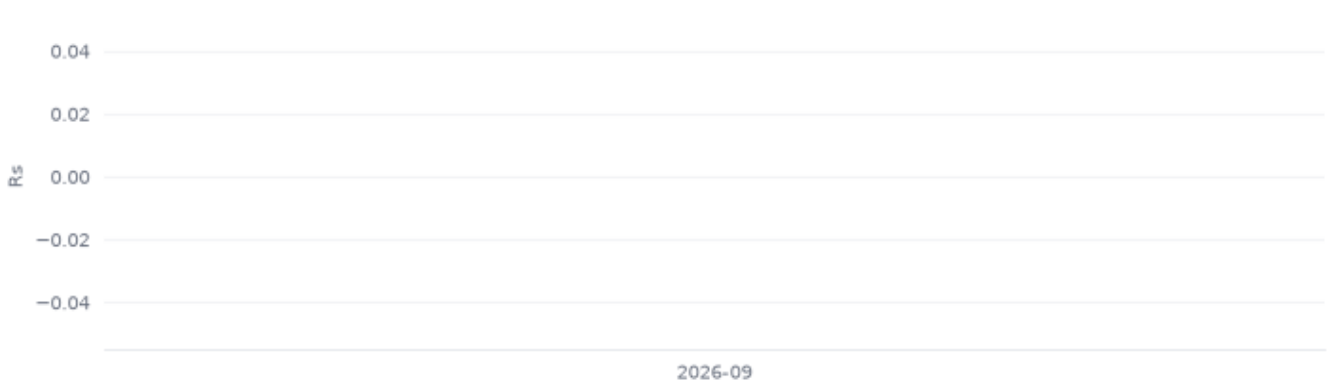

Daily Return Distribution

How many days landed in each return range. Red bars = losing days, green = winning days. A cluster of tall bars near zero with a few scattered further out is normal -- most days small, a few days big.

Monthly Performance

Total P&L for each calendar month. A month can only show one bar even if it had both winning and losing days inside it -- see Daily Return Distribution above for the day-by-day win/loss split.

Month	P&L (Rs)	Trades
2026-09	0	1

Trade Log

All 1 resolved trades, most recent first.

Symbol	Action	Entry Time	Exit Time	Entry	Exit	Qty	P&L (Rs)	Reason
BANKNIFTY	SELL	2026-09-03 10:44	2026-09-03 11:09	57682.20	57682.20	30	0	Bias flipped opposite
